Dear Artiom Kovnatsky,

Thank you for submitting your work to arXiv.

Your submission has been received and is under consideration. The temporary submission number is: submit/6929649.

As with all submissions, this work will go through technical and moderation checks. You will be contacted by arXiv when the work is announced or if any issues are identified.

Our goal is to screen and announce papers as quickly as possible while ensuring that papers meet long-term archival standards. Generally, this process takes two business days, with announcements occurring at 20:00 ET, Sunday through Thursday.

You can make changes and view the current status of the submission from your user dashboard:

<https://arxiv.org/user/>.

Below is a copy of the submission information.

Regards,
arXiv Support

Title: S.V.E. III: The Protocol for Academic Integrity: An SVE Blueprint for a Verifiable and Antifragile Scientific Record

Authors: Dr. Artiom Kovnatsky

Categories: [cs.CY](#) [cs.AI](#) [cs.CL](#) cs.DL

Comments: Part of the S.V.E. (Systemic Verification Engineering) series. | 5 figures, 1 table. Keywords: academic integrity, peer review,

SYSTEM-PURGATORY, Epistemological Boxing, reproducibility crisis, vectorial purification, integrity score, antifragile science, computational verification, ROI of science

\\

Academic institutions face a structural crisis of trust, driven by "publish or perish" incentives and an opaque peer review process that have led to a

systemic reproducibility crisis, not to mention the ever-growing workload on researchers and reviewers which drains time and attention, making nuanced verification nearly impossible, especially amid the rise of AI-assisted publications.

This paper presents SYSTEM-PURGATORY, a specific instantiation of the Systemic Verification Engineering (S.V.E.) framework designed to address this challenge. It transforms peer review into a transparent, Socratic "Epistemological Boxing Match" between a human author and an AI antagonist, arbitrated by a tri-judge AI panel. The process yields a public, quantitative Integrity Score derived from the vectorial purification of the research thesis. We detail the protocol's architecture, its economic justification via the "ROI of Verifiable Science", and its antifragile design.

Following the symbolic withdrawal of my first PhD paper (arXiv:1210.0026) as an open call to reform peer review, acknowledging that Fig. 7 was not reproducible due to the omission of MSER and manual correction, I propose the practical implementation of the S.V.E. framework (see GitHub: github.com/skovnats/SVE-Systemic-Verification-Engineering) as a constructive step toward verifiable science. This is my small contribution to the broader discussion, or in the metaphor of S.V.E. I, my "guess of the ox's weight".

All S.V.E. papers were developed in collaboration with AI language models, since English is not my native language and writing has never been my strongest skill. This process itself serves as a real-world demonstration of human-AI co-authorship within the proposed verification framework.
