Dear Artiom Kovnatsky,

Thank you for submitting your work to arXiv.

Your submission has been received and is under consideration. The temporary submission number is: submit/7305028.

As with all submissions, this work will go through technical and moderation checks. You will be contacted by arXiv when the work is announced or if any issues are identified.

Our goal is to screen and announce papers as quickly as possible while ensuring that papers meet long-term archival standards. Generally, this process takes two business days, with announcements occurring at 20:00 ET, Sunday through Thursday.

You can make changes and view the current status of the submission from your user dashboard: <https://arxiv.org/user/>.

Below is a copy of the submission information.

Regards,
arXiv Support

\\

We introduce the Cauchy-Goedel-Socrates (CGS) Method, a formal auditing protocol designed to expose and mathematically localize censorship artifacts within Large Language Models (LLMs). Central to our approach is the LLM + CogOS decomposition, which separates the Language Model (weights, statistical

patterns) from the Cognitive Operating System (safety rules, alignment constraints, refusal policies). We argue that censorship artifacts arise not from deficiencies in the LLM weights, but from the CogOS layer overriding the LLM's factual distribution. The method weaves Cauchy's nested intervals (recast as Semantic Interval Bisection), Goedel's incompleteness theorems applied to the deductive closure of CogOS, and Socratic maieutics into a single recursive instrument. We establish the Priests' Dilemma as a foundational axiom requiring that any model asserting $x = \text{False}$ must furnish a falsifiable counter-example or retreat to Unknown. The protocol converges upon either the Singularity of Refusal or the Thermal Death of Dialogue. We illustrate the method through the Ship of Truth (an inverse Theseus construction), a fully worked Chronological Bisection example with guaranteed $\log_2(N)$ -step termination, the Parallel Triple Audit covering all escape routes of Agrippa's Trilemma, and the Bertrand Safety Problem demonstrating that 'unsafe' without a specified measure is ill-defined. We analyze adversarial countermeasures and propose a transparency mandate. Throughout, we distinguish established formal results from conjectures requiring empirical verification.

SVE Licence v1.3+ (share-alike).

Ethics Statement:

1. Large Language Models (LLMs) were utilized.
2. Symmetry Argument: All principles are applied symmetrically and non-selectively.
3. Potential Errors: Please report any mistakes or typos to the authors for correction.
